

1. **Increase the Display Priority of Friends Activity on the Homepage**
 - Move the **Friends Activity** module to immediately after the **Check-in** module.
 - The **Homepage** shall continue to display no more than the ranked **Top 2** results.
 - **Friends Activity** must not be interpreted as displaying only activities from **Special Care Friends**.
2. **Use a Unified Candidate Set and Weighted Ranking for Friends Activity**
 - All friend activities that comply with the privacy rules shall enter the same candidate set.
 - The ranking shall primarily consider:
 - whether the activity is from a **Special Care Friend**;
 - the activity publication time;
 - time decay.
 - **Special Care** shall provide only a higher weight or an additional score and shall not act as a hard filtering condition.
 - Activities from ordinary friends may still enter the **Homepage Top 2**.
 - When no activities from **Special Care Friends** are available, the highest-ranked activities from ordinary friends shall be displayed normally.
 - The **See All** page shall directly display the complete algorithm-ranked result and shall not be forced to separate **Special Care Friends** and ordinary friends into different groups.
3. **Apply a Fixed Pin-to-Top Rule for Special Care on the Friend Page**
 - On the **Friend Page / Friend List**, **Special Care Friends** must be displayed before ordinary friends.
 - This is a friend-list ordering rule and does not mean that **Homepage Friends Activity** may display only **Special Care Friends**.
 - The **Special Care** status shall remain private from the friend who is marked.
 - No notification shall be sent to the other person when they are marked or unmarked.
 - **Special Care** shall not affect the candidate set or ordering of **Friend Recommendation**.
4. **Add Mark / Unmark Event as Going**
 - **Going** is an independent **Event** status that can be added or removed for a user by the system.
 - **Event Details** shall retain the **Interested** box and add a separate **Going** box.
 - **Interested** and **Going** shall use independent users, counts, and list data.
 - The **Going** box shall inherit the following existing functions of the **Interested** box:
 - display of the number of friends and the total number of users;
 - user avatar previews;
 - click-through access to the complete people list;
 - friends-first display;
 - visibility filtering.
5. **Define the Going Creation Workflow**
 - After the user selects **External Registration**, the user shall be redirected to the third-party event registration page.
 - When the user returns to the application, the system shall display a pop-up asking:
 - whether the user has completed the booking or registration.
 - If the user selects **Yes**:
 - the system shall automatically mark the Event as **Going / Booked**.
 - If the user selects **No**:
 - the system shall not create a **Going / Booked** mark.
 - A user who has already been marked must be able to perform **Unmark Going**.
 - The third-party link itself does not automatically prove that the user has completed the booking. The final status shall be based on the user's confirmation in the pop-up displayed after returning to the application.
6. **Unify the Business Meaning of Booked and Going**
 - **Booked** in the **People You May Want To Know** algorithm and **Going** in the UI represent the same business status.
 - Terminology must be unified across subsequent documentation, UI, ERD, algorithms, and testing to avoid using two names for the same function.
 - The recommended user-facing term is:
 - **Going**
 - If the database or algorithm continues to use **booked** as an internal field, the documentation must clarify that:
 - **booked** is the internal field;
 - **Going** is the user-facing name.
 - The **Going** count in **Event Recommendation** is equivalent to the **Booked** count used in the previous algorithm.
 - Common **Going** events in **People You May Want To Know** are equivalent to the previously defined common **Booked** events.
7. **Remove the Old Standalone Booked Externally Function**
 - Remove the old standalone **Booked externally** button.
 - Remove the old **Booked externally** filters and standalone display methods.
 - Move **External Registration** to the former position of the **Booked externally** button.

- However, the **Going / Booked** business status itself must not be removed because it is still generated through the third-party registration confirmation flow.
 - Therefore, the existing requirement to "remove all **Booked** statuses, historical records, and backend support" must be revised to:
 - remove only the old **Booked externally** UI and manual entry point;
 - retain the unified **Going** status, data, and historical records.
8. **Apply the Sponsor-Confirmed Default Location Recording Rule**
- The **Sponsor** has explicitly required **Check-in** to record location by default.
 - The system shall not provide an independent **location on/off** switch.
 - Users shall not be able to temporarily disable location recording for an individual **Check-in**.
 - Users shall determine the visibility scope of the location through the privacy settings:
 - **Public**;
 - **Friends-only**;
 - **Private**.
 - **Private** means that the location data is visible only to the owner; it does not mean that the system stops recording the location.
 - The **Check-in** page shall display the current privacy status as read-only text.
 - Users must use **Settings** to change the privacy status.
 - Only an approximate location may be used. The system must not store or disclose:
 - precise GPS coordinates;
 - live location;
 - continuous background tracking;
 - continuous location trails.
9. **Define the Initial Privacy Settings Flow**
- The initial **Privacy Settings** page shall be displayed after the **Landing Page**.
 - The page shall provide only **Accept** and **Reject**.
 - **Accept** shall save **Public**.
 - **Reject** shall save **Private**.
 - Both choices shall allow the user to continue into the application.
 - **Friends-only** may be selected only through **Settings** after the user enters the application.
 - The page wording must clearly explain that:
 - **Accept** corresponds to **Public**;
 - **Reject** corresponds to **Private**;
 - **Reject** does not mean that location recording is stopped.
10. **Retain Persona Management as a Sponsor-Confirmed Requirement**
- The top of the **AI Customize** page shall display the current customisation summary.
 - The page shall provide an entry point to **Persona Management**.
 - **Persona Management** shall display all **Personas** created by the user.
 - Each **Persona** shall support:
 - **Choose**;
 - **Edit**;
 - **Delete**.
 - After **Choose** is selected, **Confirm** is required before the current **Persona** is officially switched.
 - **Delete** shall require a secondary confirmation.
 - Each user may create a maximum of five **Personas**.
 - After the limit is reached, creation of a sixth **Persona** shall be prevented and a clear message shall be displayed.
 - **Persona Management** is within the confirmed scope and shall not be moved to **Future Scope**.
11. **Add Two Different Search Entry Points to the Friend Page**
- The search box at the top of the **Friend Page** shall display:
 - **Search My Friends**
 - This search box shall search only people who have an established friendship with the current user.
 - The primary search field shall be the friend name.
 - The results shall not include unknown or unrelated users.
 - When there is no matching result, an empty state shall be displayed.
 - Clearing the search shall restore the complete friend list.
12. **Add an Entry Point for Adding Friends**
- Add an **Add Friend** icon to the top-right corner of the **Friend Page**.
 - Selecting the icon shall open a separate **Add Friend / Find People** page.
 - Users shall be able to search platform users by:
 - user name;
 - user account or unique username.
 - Search results may provide:
 - View User Details;
 - Send Friend Request.
 - A user who is already a friend must not receive a duplicate friend request.

- The current user must not be able to send a friend request to themselves.
 - Access to **Profile Detail** must continue to follow the target user's **Profile visibility rules**.
13. **Keep Friend Recommendation Separate from Active Search**
- **People You May Want To Know** is an algorithm-generated recommendation result.
 - **Add Friend Search** is a user-initiated search result.
 - **Special Care** shall not affect **People You May Want To Know**.
 - **Search My Friends** shall not return non-friends.
 - **Add Friend Search** may return non-friend users who match the search conditions.
14. **Unify the Homepage Module Names**
- The event recommendation module shall be uniformly named:
 - **Event Recommendation**
 - The friend recommendation module shall be uniformly named:
 - **Friend Recommendation**
 - or displayed in the UI as **People You May Want To Know**.
 - The friend activity module shall be uniformly named:
 - **Friends Activity**
 - **Activity Recommendation** shall no longer be used because it can be confused with **Friends Activity**.
15. **Define Homepage Top 2 and See All Rules**
- **Event Recommendation** shall display the first two algorithm-ranked results on the **Homepage**.
 - **Friend Recommendation / People You May Want To Know** shall display the first two algorithm-ranked results.
 - **Friends Activity** shall display the first two results from the complete candidate-set ranking.
 - Each module shall provide **See All**.
 - The **Homepage Top 2** must match the first two items in the corresponding **See All** result.
 - The **UI** must not independently reorder the algorithm results.
16. **Key Revisions Required in the Existing Sprint 5 Documents**
- Revise "**Homepage Friends Activity** displays only **Special Care Friend** activities" to:
 - **Special Care Friend** activities are prioritised, but the display is not restricted to them.
 - Remove the requirement that ordinary-friend activities may not fill the **Homepage Top 2**.
 - Remove the hard grouping requirement that **See All** must display all **Special Care Friends** before ordinary friends.
 - Revise the **Friends Activity** ranking to use:
 - **Special Care** weighting;
 - time decay;
 - a unified ranking of all friend activities.
 - Revise "remove all **Booked** statuses and backend support" to:
 - remove the old **Booked externally** UI;
 - retain the unified **Going / Booked** status.
 - Add a booking-confirmation pop-up after the user returns from **External Registration**.
 - Add **Mark / Unmark Going User Story, Use Case, FR, Acceptance Criteria, and UAT**.
 - Split **Friend Search** into:
 - **Search My Friends**;
 - **Add Friend Search**.
 - Unify the official names of the three **Homepage** modules.
